Problem Description
A container shipping company needs to optimize empty container repositioning across a two-tier network of seaports {H1, H2} and dry ports {L1, L2, L3} over 3 time periods, minimizing total operating costs...

Start
Problem Description $P$
Initialize the message pool $C$, the stack $H$, and the iteration step index $k = 1$.
Iterative Modeling
Agent Selection $a_i \leftarrow a_0(P, C)$
Action Execution $y_i \leftarrow a_i(P, C)$
Push $a_i$ onto the stack $H$. $C := C \cup \{y_i\}$
$k > K$?
N
Y
$k := k + 1$
Feedback signal $Y$
success?
N
Y
Output the optimal solution $Y$
End
Manual intervention & Requirement clarification $P$
Exception Backtracking
$H \neq \{\}$?
N
Y
Error: $\delta_i = 1$?
N
Y
$a_i$ determines $\delta_i$ based on $y_i$ and the current failure information.
Pop the top element $a_i$ from stack $H$ $a_i = H.pop()$
$C := C \cup \{Y\}$
